

DRAW THE PATH: PORTFOLIO SiTEMAP + TOOLKiT

Prepared by:

- **Anmol Ihsan**

1. Portfolio Sitemap Sketch

The sitemap is designed to be minimal and laser-focused on guiding a visitor from awareness to the single, desired action.

Sitemap Structure:

1. Home / Hero: This is the primary landing page.

Purpose: To immediately state the core claim and value proposition.

Content: A clear headline and sub-headline that explain what the visitor will get. The primary call-to-action button like See My Work, Get in Touch is prominently placed here.

2. Work / Case Studies:

Purpose: To prove the claim with tangible evidence.

Content: A showcase of 3-5 key projects. Each project features a compelling image, a brief description of the challenge, the solution implemented, and most importantly, the results achieved. This section demonstrates capability and expertise.

3. About:

Purpose: To build trust and personality.

Content: A short, professional bio that explains who the person is, their background, their philosophy, and why they are passionate about what they do. It connects the dots between the claim and the work.

4. Contact:

Purpose: To enable the one action like a booking, an inquiry, a call.

Content: A simple contact form, an email address, and links to professional social media profiles. The action here is clear: Let's Work Together or Get a Quote.

2. Free Toolkit Accounts

The following accounts have been successfully set up:

- Claude(claude.ai)
- ChatGPT (chat.openai.com)
- Gemini (gemini.google.com)
- Perplexity (perplexity.ai)

3. Claude Project Setup & Configuration

A new Claude Project named "Portfolio Build" has been created.

Project Configuration:

a. Name: Portfolio Build

b. Custom Instructions :

Act as my tutor for the next 8 weeks. I am building a professional portfolio to prove my AI fluency. My core claim is: *I can leverage AI to solve complex business problems and drive measurable growth.* Guide me through the design and development process, ensuring every

element of the portfolio supports this claim and leads visitors to contact me. Provide critical feedback and be a strict but supportive mentor.

c. **Knowledge:** No specific files added yet, but the project context is set.

4. Pressure-Test Prompt & Output

Prompt:

Pressure-test my portfolio sitemap: Home/Hero, Work/Case Studies, About, Contact. Evaluate it strictly against my one action a 'Contact Me' submission and my core claim: I can leverage AI to solve complex business problems and drive measurable growth.' Point out any logical gaps, missed opportunities, or redundancies.

Claude's Output:

Solid bones, but as it stands this sitemap is a "brochure," not a "conversion funnel." Let's pressure-test each node against your claim and your single action.

- 1. Home/Hero — mostly fine, but check the hero copy itself**
The page node is fine; the real risk is what's on it. If the hero just says "I leverage AI to solve business problems," that's a claim, not proof. A hero that states the claim with no immediate evidence (a number, a logo, a one-line result) makes the visitor do all the work of clicking into Work to verify you. Put a proof snippet in the hero — one metric, one client type — so skepticism starts dropping before they even scroll.
- 2. Work/Case Studies — this is your entire argument, and it's underspecified**
This node is doing 90% of the credibility lifting, so "Work/Case Studies" as a single sitemap entry is too vague to trust yet. Two real gaps:

- **Structure gap:** Is this a list page linking to individual case study pages, or one long scroll? If each case study doesn't independently walk Business Problem → AI-driven approach → Measurable outcome, you don't have proof of your claim, you have a list of projects. The claim is specifically about AI leverage *and* measurable growth — if either half is missing from any single case study, that case study doesn't actually support your thesis, it's just portfolio filler.
- **Missing "how" gap:** Outcomes alone prove you got lucky once. Nothing in this sitemap shows your *process* — the actual AI tools/workflow you used. A hiring manager or client isn't just buying past results, they're buying a repeatable method they can apply to *their* problem. Right now there's no artifact that transfers that confidence. Consider whether "process/methodology" lives inside each case study or deserves its own visibility.

3. About — biggest redundancy risk on the sitemap

This is the page most likely to quietly undermine your claim. "About" pages default to career-story mode ("I've always been passionate about...") which is generic and does nothing your claim needs. If About restates the same claim in prose form with no new evidence, it's redundant with Home. About should have one job only: answer "why should I trust *this person specifically* to do it again for me" — credibility signals (background, tools mastery, maybe a philosophy on AI-augmented work) that Home and Work don't cover. If it can't do that unique job, it shouldn't be a top-level nav item — fold it into a sidebar/footer bio instead and give that nav slot to something with more conversion power.

4. Contact — check it's not the only conversion path

Making Contact a *destination page* means every conversion requires a visitor to notice it in nav, decide to click, then act — that's three friction points for your one action. Strict question: is "Contact Me" **also** a persistent CTA (header ↓ on, end of every case study, footer) or does it *only* live at the end of the site architecture? If it's only a nav item, you're relying on

Missed opportunity worth naming: nothing in this sitemap *demonstrates* AI fluency live — it only *describes* it. Since your claim is specifically about AI leverage, a small interactive element (even something modest — an AI-powered tool embedded in a case study, or a chat-based demo) would be far stronger proof than prose case studies alone, and it's currently absent from the architecture entirely.

Bottom line: your sitemap has the right node count, but two of the four nodes (About, Contact) have unclear or weak jobs, and the node doing the real work (Work/Case Studies) isn't specified enough to guarantee it proves both halves of your claim. Before you build anything, I'd want a one-paragraph "job description" for each page — what it must prove, and what CTA sits on it — so nothing on the site is there just because sitemaps conventionally have four boxes.

Want to draft those page-level job descriptions next, or pressure-test a single case study's structure first?
